Schaltblitz universal

At switching lightning three cables are to be attached,
Black to the mass U-.

Red to switched U+.

Blue to the tachometer cable

The attitude of switching lightning is made over a small turnable regulator. The turnable regulator has a range of adjustment of 25 revolutions. With the distribution the turnable regulator (spindle trimmer, potentiometer) on approx. stands on 15 revolutions.

For testing turn the potentiometer to the left, then the LED is cluster constantly on. The further the potentiometer is turned to the right, the number of revolutions, which the LED again to shine for cluster brings, is the higher.

Much fun with the installation.
